

Special Issue

Research on Pain Measurements and Pain Outcome Variables

Message from the Guest Editor

The importance of individual patient characteristics combined with psychological evaluations, biological information, social influences and other related aspects are the key to properly evaluate the impact of pain on an individual person. Several other outcome mechanisms that might be influenced by pain have been explored as complementary tools or substitutes for a pain intensity report.

This Special Issue is focusing on innovative pain measurements and pain outcome mechanisms to strive towards a better quantification of the level of pain. Additionally, in the search for new pain measurement strategies, advanced statistical techniques are helping us to unravel potential biomarkers for pain, to define surrogate markers and to construct composite measures. Manuscripts addressing these topics or related topics are invited for this Special Issue, especially those combining a high academic standard coupled with innovative ideas about pain measurements and outcome variables or high-quality statistical analysis. Applications of these methods in specific pain patient populations or related to specific treatment modalities will be eligible as well.

About the Journal

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Scientific discoveries and advances in this research field play a critical role in providing a rational basis for informed decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards.

IJERPH provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality peer-reviewed journal.
