

## Special Issue

# Factors Associated with Successful Smoking Cessation

### Message from the Guest Editor

The aim of this special issue is to highlight individual traits, interventions, programs and/or policies associated with successful smoking cessation. Success with reducing tobacco consumption and smoking cessation at a population level requires a multi-level approach to governmental policies and regulations, community interventions and health system programs and supports. At an individual level, demographic, behavioral and environmental factors can all influence a person's chance of realizing smoking cessation. Given the tight association between poverty, marginalization and deprivation and continued smoking behavior, there is an urgent need to examine policies, programs, and interventions that take into consideration and/or focus on these structural factors when addressing smoking cessation. This Special Issue covers various approaches to successful smoking cessation with a focus on policies, programs, interventions targeting marginalized populations. Original papers and Reviews that incorporate culturally-sensitive and equity-focused programs and policies are encouraged.

## About the Journal

### Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Scientific discoveries and advances in this research field play a critical role in providing a rational basis for informed decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards.

*IJERPH* provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality peer-reviewed journal.
