

Special Issue

Secondary Health Data for Monitoring Chronic Health Conditions and Assessing Healthcare Performances

Message from the Guest Editors

Chronic diseases are a threat to people's health and to the sustainability of health organisations. Despite the considerable amount of research conducted during the past few decades to describe the epidemiology and the impact on the health of chronic diseases, because of the population aging, the disease burden and multimorbidity have increased, leading to higher patient frailty. Therefore, new evidence is needed to assess the impact of chronicity in the population, its evolution over time, the impact of new technologies in disease management and to design appropriate adaptation to health policies.

This Special Issue of IJERPH is addressed to studies using secondary health data for monitoring chronic health conditions, analysing their determinants, and evaluating healthcare interventions in chronic patients.

About the Journal

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Scientific discoveries and advances in this research field play a critical role in providing a rational basis for informed decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards.

IJERPH provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality peer-reviewed journal.
