Sedentary Behavior across the Life Course and Associations with Health

Message from the Guest Editor

Sedentary behavior has recently emerged as a new research focus, owing not only to modern life, in which sitting has become the dominant posture for most activities, but also to its associations with various health indicators. Furthermore, sedentary behavior is prevalent in all age groups and in a variety of settings. As sedentary behavior is a recent research topic, several aspects must be thoroughly investigated. Submissions on the following topics (though not limited to) are thus encouraged:

- Factors influencing sedentary behavior;
- Interventions targeting sedentary behavior;
- Various settings (e.g., childcare, school, home, office, retirement home, transport);
- Measurement of sedentary behavior;
- The role of peers, family, teachers, members of the community, etc.

Researchers are invited to contribute novel work to be considered for publication in this Special Issue. Submissions may include original articles, short communications, or review articles (systematic review or meta-analyses). There are no restrictions regarding study design and methodology.

About the Journal

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Scientific discoveries and advances in this research field play a critical role in providing a rational basis for informed decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards.

IJERPH provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality peer-reviewed journal.

Editor-in-Chief
