Planning Technologies for Sustainable and Healthy Cities

Message from the Guest Editor

We are looking for a sustainable and healthy city around the world. In developed countries, urban form, land use and transportation systems, and the allocation of urban service functions that are easy to live in for the elderly are urgent issues. Oppositely, in developing countries, there are still various environmental problems. How to solve these is an extremely important issue of urban or regional planning. In addition, there are many natural disasters around the world, and research on a resilient city that is resistant to disasters to protect people's lives and lives is also progressing. On the other hand, the rapid development of information and communication technology in recent years is trying to have a significant impact on the research and development of planning technology in the urban planning field. Therefore, we welcome novel research and development results of planning technologies to urban planning methods, or new ones of spatial analysis and modeling and planning support systems. The target to apply planning technologies ranges from urban/regional planning processes and practice to natural disaster countermeasures and environmental management.

About the Journal

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Scientific discoveries and advances in this research field play a critical role in providing a rational basis for informed decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards.

IJERPH provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality peer-reviewed journal.

Editor-in-Chief

Prof. Dr. Paul B. Tchounwou
