

Special Issue

Health and Healthcare for People with Diabetes

Message from the Guest Editors

Diabetes mellitus is a public health problem. According to the World Health Organization (WHO), the global prevalence of diabetes mellitus is 9% among adults over 18 years of age. This makes the clinical management of diabetic patients of vital importance. The study of the evolution of the disease, the clinical involvement, and the consequences it entails in the lower limb are a matter of continuous scientific study. The care of the lower limb from the podiatric point of view, specifically the management of the diabetic foot, aims to increase the quality of life of patients. The complications of diabetes in the lower limb (neuropathy, arthropathy, wounds, amputations) must be minimized to avoid major damage that compromises the patient's quality of life. Articles addressing these topics are invited for this Special Issue, especially those that combine a high academic and scientific level together with a practical approach to provide optimal solutions for the improvement of the diabetic patient. **Keywords**✉

- diabetes mellitus
- diabetic foot
- healthcare
- clinical management

About the Journal

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Scientific discoveries and advances in this research field play a critical role in providing a rational basis for informed decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards.

IJERPH provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality peer-reviewed journal.
