Special Issue

The New Era of Treatment for Obesity

Message from the Guest Editors

In recent years, scientific research has led to a better understanding of the pathophysiology of obesity. Despite these advances and increasing treatment options, a significant percentage of patients with obesity do not respond to treatment. Given the growing number of people with overweight and obesity, and the enormous healthcare costs associated, it is crucial that new effective and safe therapies are introduced. It has recently been discovered that the microbes residing in the human gastrointestinal tract act as an 'endocrine' organ, whose composition and functionality are a consequence of poor nutrition but, at the same time, may partly contribute to obesity. Bariatric surgery has also emerged in recent years as a valuable therapeutic option, especially in severely obese individuals and/or those with serious complications. Similarly, new drugs for treating obesity have been proposed, but their use is still limited by modest efficacy, safety issues, and, in particular, high costs. The aim of this special issue is to evaluate new, scientifically validated treatment options that could represent a significant breakthrough in the treatment of obesity

About the Journal

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers.

Scientific discoveries and advances in this research field play a critical role in providing a rational basis for informed decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards.

IJERPH provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality peer-reviewed journal.

Editor-in-Chief

Prof. Dr. Paul B. Tchounwou
