Special Issue

Measuring Health Inequities Among Vulnerable Populations (2nd Edition)

Message from the Guest Editors

The WHO defines health inequities as avoidable inequalities in health between groups of people within countries and between countries. These inequities are driven by environmental, social, and economic conditions, which increase the risk of illness, disease, and the inability to prevent them at the individual, household, community, national, and international levels. This culminates in a health continuum, with the poor and nonpoor at extreme ends. Health inequities are rooted in social injustices that result in some population groups being more vulnerable to poor health than others. The ability of health practitioners, academics, researchers, governments, and agencies to quantify health inequities has been found to facilitate estimating prevalence and identifying hotspots, targeting of appropriate resources to vulnerable populations, and developing interventions in bridging health inequities. This Special Issue calls for studies on the measurement of health inequities among vulnerable populations and developing tools/constructs/indicators that facilitate the study of environmental, global, and public health research targets.

About the Journal

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers.

Scientific discoveries and advances in this research field play a critical role in providing a rational basis for informed decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards.

IJERPH provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality peer-reviewed journal.

Editor-in-Chief

Prof. Dr. Paul B. Tchounwou
