

Special Issue

Water Pollution and Eutrophication Control in River Basins

Message from the Guest Editor

This Special Issue will be devoted to watershed environment problems and watershed recovery. We call for papers focused on issues such as eutrophication control, nutrient element migration, transformation and destination, as well as papers related to water environment restoration in watershed. Eutrophication is an important problem troubling the water environment and water ecological health of watershed. In recent years, with the attention paid to the water environment of watershed by various countries, the trend of eutrophication has been greatly curbed. However, how to effectively and efficiently control eutrophication and promote the sustainable improvement of the water environment and water ecology in the watershed needs more support from the innovation of technology and management measures. Submissions should address eutrophication-related problems in the watershed, including relevant problems including source identification and investigation into the migration and transformation processes of nutrients in the watershed. Innovations in eutrophication-related watershed management measures are also welcomed.

About the Journal

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Scientific discoveries and advances in this research field play a critical role in providing a rational basis for informed decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards.

IJERPH provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality peer-reviewed journal.
