Advances in Anxiety Disorders and Somatic Conditions Research

Message from the Guest Editor

Research in the last 25 years has shown strong links between somatic conditions and psychiatric disorders. Whereas mood disorders are often found closer to mechanisms of inflammation, anxiety disorders have been found to be strongly associated to some heritable conditions of connective disorder. On the other hand, research on several somatic treatments with body involvement, extensively used but somehow neglected, such as relaxation, vagal functioning, and rapid eye movement, among others, have provided significant new clues to understand the neurobiology of anxiety and stress. These clinical, neurophysiologic, and therapeutic fields will be updated, and a comprehensive model of illness, the neuroconnective phenotype, will be explored to pave the way to progress in that field.

About the Journal

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Scientific discoveries and advances in this research field play a critical role in providing a rational basis for informed decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards.

IJERPH provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality peer-reviewed journal.
