

Special Issue

State of Art in Applied Medicine and Rehabilitation

Message from the Guest Editor

According to the World Health Organization (WHO), the rehabilitation of patients with acute or chronic physical conditions should follow the International Classification of Functioning, Disability and Health (ICF) model. The ICF model relies on the “dynamic interaction between a person’s health condition, environmental factors, and personal factors”, which determines the bio-psycho-social approach to current rehabilitation strategies. This Special Issue will focus on current research advancing any of the three ICF model pillars (from the biological perspective, via basic and applied sciences research on environmental and psychological factors that play key roles in the recovery of patients). We welcome manuscripts covering a broad overview of research topics to enhance the applied medicine and rehabilitation field. These topics can be related to basic or applied sciences, such as vascular biology and exercise physiology, or to environmental and psychological factors associated with the bio-psycho-social aspects of physical rehabilitation.

About the Journal

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Scientific discoveries and advances in this research field play a critical role in providing a rational basis for informed decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards.

IJERPH provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality peer-reviewed journal.
