Asthma Risk and Prevention

Message from the Guest Editor

Asthma is a chronic disease which can affect individuals over the course of a lifetime. According to the World Health Organization (WHO 2017) approximately 235 million people suffer from asthma worldwide with most asthma-related deaths occurring in low- and lower-middle income countries. Children are a particularly vulnerable population for asthma exacerbation effects, especially when the built environment and air pollution are considered. Asthma may have far-reaching health impacts including effects on physical activity and resulting obesity outcomes. Asthma can be a debilitating disease which can impact socioeconomic status, education outcomes and work productivity due to missed days for sickness. While the exact cause(s) of asthma remain unknown, understanding risk and prevention remains an important objective of public health research. Research across the lifespan, both in cities and rural areas and in both developing and developed countries, can offer a critical guide for policy efforts and planning for public health. This Special Issue is open to any subject area related to asthma risk and prevention.

About the Journal

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Scientific discoveries and advances in this research field play a critical role in providing a rational basis for informed decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards.

IJERPH provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality peer-reviewed journal.
