Back and Neck Pain

Message from the Guest Editor

Back and neck pain is a common complaint in one or more areas of the neck, mid- and upper back, or low back. The Global Burden of Disease study ranks musculoskeletal neck pain along with low back pain as the leading cause of non-fatal disability in almost all age groups. There are many risk factors for back and neck pain, such as age, gender, lifestyle, physical activity, injury, or genetic and congenital conditions, among others. Similarly, treatments for back and neck pain are variable in an attempt to match the underlying risks and etiologies. This Special Issue aims to serve as a platform for scientific evidence on the risk factors, prevention, diagnosis, and treatment of back and neck pain.

About the Journal

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Scientific discoveries and advances in this research field play a critical role in providing a rational basis for informed decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards.

IJERPH provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality peer-reviewed journal.
