Bullying: Causes, Consequences, Interventions, and Prevention

Message from the Guest Editor

Bullying—repetitive unwanted aggressive behavior rooted in power differentials between the aggressor and their target—remains a persistent problem facing adolescents. Recent studies show that one in five adolescents will experience bullying at some point. This is a troubling statistic, as being bullied correlates with an increased likelihood of experiencing low self-esteem, depression, anxiety, fear, and even suicidal behavior. Given the severity of the problem, it is imperative that researchers continue to explore all aspects of bullying, including risk factors for bullying and being bullied, how bullying affects targets and those who witness it, the role of the Internet in facilitating bullying, and how peers, parents, teachers, and law enforcement personnel can help prevent adolescent bullying, aid those being bullied. This Special Issue therefore seeks papers advancing knowledge on adolescent bullying from diverse perspectives.

About the Journal

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Scientific discoveries and advances in this research field play a critical role in providing a rational basis for informed decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards.

IJERPH provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality peer-reviewed journal.
