Cancer Health Disparities

Message from the Guest Editor

The progress in cancer prevention has not been experienced equally across the population, with significant disparities observed according to sociodemographic characteristics. Increasingly, researchers and policymakers have focused on the role of geography in the emergence of cancer health disparities, including regional variation, neighborhood characteristics, the built and social environment, and environmental exposures. To move the field forward, we need a more nuanced understanding of the independent and interactive effects of (1) multiple area-level characteristics, e.g., neighborhood rurality *and* employment; (2) compositional and contextual attributes, e.g., median household income *and* crime rate; and (3) multilevel variables, e.g., individual-level gender *and* the area-level poverty rate.

About the Journal

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Scientific discoveries and advances in this research field play a critical role in providing a rational basis for informed decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards.

IJERPH provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality peer-reviewed journal.

Editor-in-Chief
