Social, Economic, and Environmental Determinants of Chronic Diseases

Message from the Guest Editor

Noncommunicable diseases (NCDs) kill approximately 41 million people each year, or the equivalent of 71% of all deaths globally. Most NCD deaths are due to cardiovascular diseases (17.9 million people annually), followed by cancers (9.0 million), respiratory diseases (3.9 million), and diabetes (1.6 million) (WHO, 2018). Unhealthy diets, smoking, physical inactivity, and obesity are some of the primary established risk factors for developing and dying from chronic diseases. We welcome any original theoretical or empirical work that could lend key insights into the impacts of social determinants on incidence and mortality from major chronic diseases (including but not limited to the diseases mentioned above) and their risk factors. Regarding social determinants, we are especially interested in upstream social, economic, and environmental factors that could help to inform policymakers and public health practitioners in their ongoing efforts to reduce the burden of chronic diseases locally, nationally, and globally.

About the Journal

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Scientific discoveries and advances in this research field play a critical role in providing a rational basis for informed decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards.

IJERPH provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality peer-reviewed journal.
