Effective Management of Chronic Diseases: Prevention, Assessment and Treatment

Message from the Guest Editors

Chronic diseases are nonreversible, long-duration, slowly progressing pathologies. Approximately one in three adults suffers from multiple chronic diseases, which represent the leading cause of disability worldwide. The most prevalent chronic conditions are cardiovascular disease, chronic lung disease, diabetes, and chronic kidney disease, which are commonly associated with higher healthcare use and the worst clinical profile when healthcare is disrupted. Identification of at-risk populations, early diagnosis, and prognosis prediction play major roles in preventing or reducing the burden of chronic illness. Addressing chronic disease is a major challenge for healthcare systems around the world, as it requires a long period of supervision, observation, care and/or rehabilitation. This Special Issue in the *International Journal of Environmental Research and Public Health* calls for papers addressing these topics, especially those investigating pharmacological and/or non-pharmacological medicine and care provided by allied health professionals in primary and specialty care to prevent, manage, assess, and treat chronic disease.

About the Journal

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Scientific discoveries and advances in this research field play a critical role in providing a rational basis for informed decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards.

IJERPH provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality peer-reviewed journal.

Editor-in-Chief
