

Special Issue

Remediation of Contaminated Environments and Pollution Control

Message from the Guest Editor

Environments contaminated with heavy metals, nitrogen, phosphorus, persistent organic contaminants, and others pose direct and potential risks and hazard to human and ecological health. The consequent environmental problems are one of the main reasons restricting economic development and quality and safety of human life around the world, especially in China. In the past several decades, plenty of research has been carried out on the cleanup of these environmental pollutions; however, certain types of pollution currently persist in their severity. Hence, it is necessary to stabilize or remove contaminants from the environment and simultaneously control the release of pollutants into the environment using innovative physical, chemical, biological technologies and approaches and their combinations. This Special Issue aims to publish research on the remediation of contaminated soils, sediments, groundwater, and surface water and pollution control in wastewater and non-point source pollution.

About the Journal

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Scientific discoveries and advances in this research field play a critical role in providing a rational basis for informed decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards.

IJERPH provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality peer-reviewed journal.
