Special Issue

COVID-19: Prognosis, Outcomes and Long-Term Sequelae

Message from the Guest Editors

The first cases of Coronavirus disease 2019 (Covid-19) were reported in China in Dec 2019 and since then the pandemic has rapidly spread across the continents. The long-term problems and outcomes in Covid-19 survivors is currently unknown. We however know that previous outbreaks of coronavirus and Ebola virus have caused immunological, radiological, functional and psychological abnormalities of varying degrees. Persistent problems of pulmonary function, weakness, chronic pain, fatigue, depression, anxiety, PTSD, vocational problems and reduced quality of life have been observed in survivors of these previous outbreaks.

This special issue is aimed at articles of high academic standard investigating these persistent or emerging long-term problems in the physical, psychological and social domains. We would like to focus on the management of survivors beyond the acute stages of illness and help maximise functional ability by optimised interventions. Authors can submit original research, systematic review, case report and service evaluation audits related to any of these aspects of Covid-19 or previous coronavirus outbreaks.

About the Journal

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Scientific discoveries and advances in this research field play a critical role in providing a rational basis for informed decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards.

IJERPH provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality peer-reviewed journal.

Editor-in-Chief
