Evidence-Based Health Policy-Making and Health Outcomes Research

Message from the Guest Editor

Health systems worldwide have contributed to better health and life expectancy with varying degrees of success for many years with limited resources. The primary purpose of any health system is to improve the health status of the population, protect society and people from possible financial risks with sustainable financing schemes, and maximize the health system users' satisfaction with health care. In achieving this goal, it is crucial to allocate resources devoted to health efficiently. Estimating the costs of health interventions and health outcomes improvement is essential for policymakers for several reasons, including ensuring that results can be used to assess and improve health system performance and lower the burden of disease. Papers addressing the cost-effectiveness of health interventions at all levels, health-related quality of life, health technology assessment, the economic evaluation of health policies, the economic impact of health-related sustainable development goals, health outcomes measurement, the economic cost of chronic conditions, and pharmaco-economics are invited for this Special Issue.

About the Journal

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Scientific discoveries and advances in this research field play a critical role in providing a rational basis for informed decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards.

IJERPH provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality peer-reviewed journal.
