Special Issue Global Women's Health

Message from the Guest Editor

During pregnancies, women may encounter complications, including preterm births, spontaneous or artificial abortion, gestational hypertension and diabetes. For the rest of their lifetime, they may face problems that potentially threaten their health, such as endometriosis, polycystic ovarian syndrome, genital prolapse, and gynecologic cancers. In addition, fertility, contraception, the effect of environmental hormones (endocrine disruptors) on women's diseases, and health disparities of females are all important issues. In many countries, women are disadvantaged by discrimination rooted in sociocultural factors which prevent them from benefiting from quality health services, including unequal power relationships between genders, social norms that decrease education and paid employment opportunities, an exclusive focus on women's reproductive roles, and potentially physical, sexual, and emotional violence.

This Special Issue solicits original contributions and reviews that explore the natures of diseases and health impact on women in different countries and communities. Studies discussing health issues of global women mentioned above are welcomed.

About the Journal

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Scientific discoveries and advances in this research field play a critical role in providing a rational basis for informed decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards.

IJERPH provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality peer-reviewed journal.

Editor-in-Chief

Prof. Dr. Paul R. Ward
