Aging and Public Health

Message from the Collection Editors

With the world-wide growth of the older adult population, there is increased concern about the impact of aging-related consequences on health and healthcare utilization. While individuals can encounter many problems as they age, two of the most pressing issues facing older adults are falls and chronic disease. The direct and indirect costs of these public health issues are enormous and growing. Many of the known risks for falls are associated with inadequate disease management (e.g., physical activity, medication, communication with healthcare providers), which makes strategies to address these issues highly interrelated. Over the past decade, there has been an emergence of large initiatives to reduce the burden of falls and chronic conditions that draw upon evidence-based programs (EBP) and practices in community, clinical, and industry settings. Often these efforts are translational in nature and integrate technology. Additional research is needed to document the reach and effectiveness of these interventions and advance their implementation, dissemination, and sustainability.

About the Journal

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Scientific discoveries and advances in this research field play a critical role in providing a rational basis for informed decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards.

IJERPH provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality peer-reviewed journal.
