Climate and Environmental Change Impacts on Health and Health Care--The Context of Food Insecurity, Conflict and Forced Migration

Message from the Guest Editor

Environmental hazards due to climate change and other anthropogenic processes are drivers of voluntary and forced migration, both cross-border and internally. These hazards include droughts, flooding, sea level rise, storms, salinization, land degradation, and deforestation, among others. The public health implications of environmental migration, however, are still not understood well.

This Special Issue welcomes original articles that address health issues related to environmental and climate-induced migration, in particular of people displaced by droughts and land degradation in low- and middle-income countries. Topics include but are not limited to:

- slow onset events (droughts, salinization, soil erosion);
- sudden onset events (floods, cyclones);
- environmental degradation;
- cross-border migration and forced displacement, internally displaced people;
- food and water insecurity, famine;
- mortality and morbidity, including infant and child health; epidemics;
- mental health; gender-based violence;
- violent conflicts;
- availability and quality of health care services;
- living conditions in refugee camps and informal settlements.

About the Journal

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Scientific discoveries and advances in this research field play a critical role in providing a rational basis for informed decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards.

IJERPH provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality peer-reviewed journal.
