The Role of Lifestyle in Gastrointestinal Cancer: Prevention, Treatment and Survival

Message from the Guest Editors

Gastrointestinal (GI) cancers include five major types of cancers (stomach, liver, esophagus, pancreas, and colorectum) with approximately 5 million new cases and 4 million deaths worldwide in 2018. GI cancers are predicted to increase by 2040. These data highlight the continuing challenge that GI cancers present to public health. This Special Issue of *IJERPH* focuses on the current state of knowledge on the links between a broad range of lifestyle factors (including but not limited to diet, physical activity, smoking, alcohol consumption) and GI cancers. New research papers, reviews, case reports, and protocol studies are welcome to this Issue. Special attention will be paid to original research (including systematic reviews). Studies do not necessarily have to offer “positive results” (i.e., results confirming previous literature).

About the Journal

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Scientific discoveries and advances in this research field play a critical role in providing a rational basis for informed decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards.

IJERPH provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality peer-reviewed journal.

Editor-in-Chief

Prof. Dr. Paul B. Tchounwou
