Infectious Disease Epidemiology 2020: The Importance of (Re)Emerging Occupational Infectious Agents

Message from the Guest Editors

During recent years, media coverage has raised public awareness of (re)emerging biological risks, the current pandemic caused by COVID-19 being a recent example. Most of the (re)emerging biological risks also cause new occupational health risks, and therefore occupational infections are not only associated with health workers, but appear as a new and increasing cause of occupational disease, while older risks like measles are re-emerging. The epidemiology of occupational infectious diseases has some special features: workers are both 'at risk' and 'sources of risk', workers may be immune, a case may be a source without being recognized as a case, there can be a need for urgency, and preventive measures (usually) have a good scientific basis. In this Special Issue, we invite all interested researchers to contribute to our understanding of the epidemiology of occupational (re)emerging infections and preventive strategies.

About the Journal

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Scientific discoveries and advances in this research field play a critical role in providing a rational basis for informed decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards.

IJERPH provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality peer-reviewed journal.
