Oncological Rehabilitation: Strengths and Weaknesses for a Global Interdisciplinary Management of the Cancer Patient and Novel Future Perspectives during COVID Emergency

Message from the Guest Editors

Oncological rehabilitation is based on reaching an adequate quality of life for cancer patients, helping the patient and his/her family to adapt to living standards, as close as possible to those preceding the disease. The rehabilitation process in cancer patients requires a multidisciplinary and interdisciplinary approach that is based on an individual project according to the specific needs and outcomes that take into account the different phases of taking charge of the cancer patient. Therefore, a complex and long rehabilitation path, which even before the COVID-19 emergency, recognized some barriers in its practical application and which, to date, has become even more complex in its implementation.

Then, virtuous and novel rehabilitation paths are desirable in cancer patients starting from global care, taking into account the bio-psycho-social model and proposing solutions to favor a rehabilitation alliance, even in home-settings or in telerehabilitation, together with, or instead of, traditional settings (outpatient or inpatient), in order to guarantee the patient a reduction in disability and an adequate quality of life.

About the Journal

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Scientific discoveries and advances in this research field play a critical role in providing a rational basis for informed decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards.

IJERPH provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality peer-reviewed journal.

Editor-in-Chief
