Oral Health Inequalities in the World

Message from the Guest Editor

Oral health inequalities are a fundamental problem in dentistry. In the Sustainable Development Goals (SDGs) by 2030 developed by the United Nations, “Ensure healthy lives and promote well-being for all at all ages” was set as the third goal. The key targets for achieving this goal are universal health coverage and prevention and treatment of noncommunicable diseases. With regard to oral health, reducing inequalities by ensuring prevention and treatment of oral diseases is necessary for achieving this health goal for all population.

Since monitoring trends in health inequalities is part of the strategy to reduce health inequalities, reports of recent oral health inequalities from children to older people remain valuable. Studies from non-Western countries are still scarce. Research on various social determinants of inequalities and the mechanism of the determinants of oral health inequalities is required.

This Special Issue welcomes the submission of all types of studies, reviews, and short communications. I would be delighted to attract as high a diversity and heterogeneity of submissions across the world as possible.

About the Journal

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Scientific discoveries and advances in this research field play a critical role in providing a rational basis for informed decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards.

IJERPH provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality peer-reviewed journal.
