

Special Issue

Implications and Future Prospects for Periodontal Therapy around Teeth and Dental Implants

Message from the Guest Editor

The goal of periodontal therapy is to control the infection and regenerate the structure and function of periodontal tissues. Identification of susceptible subjects and evaluating them for the presence of modifiable risk factors are crucial first steps in developing action plans for proper interventions. Periodontal regeneration can be achieved to a variable extent using different surgical techniques, involving application of various types of bone and soft tissues grafts and/or substitutes, guided tissue regeneration, root surface biomodification, growth and differentiation factors, and combination approaches. The aim of this special issue is to encapsulate current knowledge in terms of the etiology, diagnosis, prognosis, treatment and implications of common periodontal conditions around teeth and dental implants in order to provide reference for the design of further clinical trials and to develop strategies to counteract their negative effects on our patient's wellbeing.

About the Journal

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Scientific discoveries and advances in this research field play a critical role in providing a rational basis for informed decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards.

IJERPH provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality peer-reviewed journal.
