Special Issue

Soil Pollution and Public Health

Message from the Guest Editors

Soils deliver a vast amount of ecosystem services, from biodiversity, to food production, to carbon storage, and flood prevention. There is an inextricable link between soils and human health. Human infections or illnesses are derived from direct ingestion of soil or aerosolized soil, or through contamination of via other pathways such as drinking water. The management of soils has significant implications for public health. This Special Issue aims to collate a series of papers summarizing new information on the linkage between soils and public health. We invite contributions that give an insight into the pathways of infection or illness, emerging risks to public health from new or rare forms of soil pollution. and the remediation of polluted soils. Finally, risk assessment studies focusing on how to mitigate the threat to public health from polluted or contaminated soils will be welcomed.

About the Journal

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Scientific discoveries and advances in this research field play a critical role in providing a rational basis for informed decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards.

IJERPH provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality peer-reviewed journal.

Editor-in-Chief
