

Special Issue

Joint Effects of Tobacco Use and Product Characteristics on Human Health and the Environment

Message from the Guest Editors

Inhaled tobacco products are used in many forms around the world, ranging from combustible forms such as cigarettes, cigars and pipes, and heated tobacco from combusted charcoal (water pipes) or electric sources (electric water pipes, heat-not-burn, tobacco heated products) to aerosolized forms from liquids and gels (electronic cigarettes and other electronic nicotine delivery systems). The environmental impacts and health effects associated with the global use of tobacco products are multi-faceted. This Special Issue explores the joint effects of user behavior and the inherent characteristics of tobacco products on human health and the environment.

We encourage manuscripts from a variety of disciplines including (but not limited to) behavioral and physical sciences, clinical medicine, dentistry, psychology and social sciences, toxicology, pharmacology, epidemiology, finance, business and marketing, engineering and technology, regulatory science, and public policy. We are particularly interested in articles which explore the relationships between two or more factors which jointly impact human health and/or the environment.

About the Journal

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Scientific discoveries and advances in this research field play a critical role in providing a rational basis for informed decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards.

IJERPH provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality peer-reviewed journal.

Editor-in-Chief
