Current Research Trends in Transgender Health

Message from the Guest Editors

TGNC people represent a community that is diverse with respect to gender, ethnicity, socio-economic status, etc. Members of the TGNC population share many common experiences, such as belonging to a stigmatized minority. Although TGNC people represent a strongly resilient community, capable of successfully overcoming negative and adverse life conditions, they still experience high levels of prejudice that negatively affect their health and wellbeing. An increasing body of literature has demonstrated that gender-related prejudice and stigma are among the main factors producing health disparities. However, the TGNC population is changing, where a great percentage of people self-identify as non-binary, genderqueer, bigender, and so on, rejecting a binary view of the TGNC identity. Therefore, we need to expand our knowledge base and look at TGNC people as a complex and segmented population with specific health needs. This Special Issue is open to any subject area related to recent advances in TGNC health, with a specific interest in innovative methods, nationally representative data, young TGNC people, health disparities, minority stress, intersectionality, and resilience.

About the Journal

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Scientific discoveries and advances in this research field play a critical role in providing a rational basis for informed decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards.

IJERPH provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality peer-reviewed journal.
