

Special Issue

Etiology and Preventive Measures to Reduce Work Related Diseases

Message from the Guest Editors

A work-related disease is caused or worsened by work activities and/or working conditions. Knowledge on the work-related risk factors and their association with the exposure is essential for the development of preventive interventions and strategies. Thorough assessment of the efficacy of prevention programs and their successive implementation will enable the creation of a healthy work environment and the prevention of occupational diseases. The present Special Issue aims to increase insight into occupational and individual risk factors, preventive interventions, and implementation strategies across different types of work-related diseases. The studies will mainly, although not exclusively, focus on musculoskeletal disorders, stress-related disorders, as well as respiratory and skin diseases. A special emphasis within this Special Issue will be placed on existing knowledge gaps such as the pathogenesis of work-related diseases and the implementation of preventive measures in various jobs and industries.

About the Journal

Message from the Editor-in-Chief

Addressing the environmental and public health challenges requires engagement and collaboration among clinicians and public health researchers. Scientific discoveries and advances in this research field play a critical role in providing a rational basis for informed decision-making toward control and prevention of human diseases, especially the illnesses that are induced from environmental exposure to health hazards.

IJERPH provides a forum for discussion of discoveries and knowledge in these multidisciplinary fields. Please consider publishing your research in this high quality peer-reviewed journal.
