Psoriasis is a serious skin disorder affecting men, women and children without any racial distinction. This pathology is characterized by the presence of red or pink patches covered by thick gray danders. Currently, the exact cause of this skin disorder is not known. However, certain mechanisms such as hyperproliferation of keratinocytes, abnormal differentiation of keratinocytes and infiltration of the skin by inflammatory cells have a role to play in the onset of this disease. Several models have been presented in recent years, including both animal and in vitro human models. However, none of these show a complete phenotype of psoriasis. In the field of science, genetically modified mouse models or xenotransplantations allow to see certain characteristics of psoriasis which makes it possible to study different aspects of the pathology. In addition, certain in vitro models made from human cells are more and more similar to the pathology and therefore make it possible to study different aspects of this disease.

This Special Issue of *IJMS* provides a comprehensive overview of the most advanced in vivo and in vitro models that feature reliable characteristics of psoriasis.
Message from the Editorial Board

The International Journal of Molecular Sciences (IJMS, ISSN 1422-0067) is an open access journal, which was established in 2000. The journal aims to provide a forum for scholarly research on a range of topics, including biochemistry, molecular and cell biology, molecular biophysics, molecular medicine, and all aspects of molecular research in chemistry. IJMS publishes both original research and review articles, and regularly publishes special issues to highlight advances at the cutting edge of research. We invite you to read recent articles published in IJMS and consider publishing your next paper with us.

Author Benefits

Open Access: free for readers, with article processing charges (APC) paid by authors or their institutions.

High visibility: indexed by the Science Citation Index Expanded (Web of Science), MEDLINE (PubMed), Scopus and other databases.

Rapid publication: manuscripts are peer-reviewed and a first decision provided to authors approximately 15.7 days after submission; acceptance to publication is undertaken in 2.9 days (median values for papers published in this journal in the first half of 2019).
