Mechanisms of DNA Replication Fork Progression, Stalling, and Rescue 2.0

Message from the Guest Editor

The DNA replication fork is an essential structure in DNA metabolism. In the absence of impediments, it is moved from the origin to the terminus by dynamic, multi-subunit replisome complexes. When replication fork progress is impeded by obstacles or discontinuities in one or both strands of the DNA duplex, there are dramatic consequences for the cell. These range from checkpoints to cell death or cancer in multicellular organisms when replication fails to restart. Consequently, significant cellular resources are reserved to ensure DNA replication fork progress ranging from unexpected behavior attributed to replisome components, proteins to stabilize fork structures, and multiple types of enzymes to the regression, repair, and restoration of fork structures. Furthermore, the structure of the fork itself plays an important role in facilitating the interactions of both replication and repair proteins with itself. Protein and nucleic acid components work together to ensure that DNA replication is completed with minimal errors in the genome.

About the Journal

Message from the Editor-in-Chief

The International Journal of Molecular Sciences (*IJMS*, ISSN 1422-0067) is an open access journal, which was established in 2000. The journal aims to provide a forum for scholarly research on a range of topics, including biochemistry, molecular and cell biology, molecular biophysics, molecular medicine, and all aspects of molecular research in chemistry. *IJMS* publishes both original research and review articles, and regularly publishes special issues to highlight advances at the cutting edge of research. We invite you to read recent articles published in *IJMS* and consider publishing your next paper with us.

Editor-in-Chief

Prof. Dr. Maurizio Battino

Department of Odontostomatologic and Specialized Clinical Sciences,
Sez-Biochimica, Faculty of Medicine, Università Politecnica delle
Marche, Via Ranieri 65, 60100 Ancona, Italy

Author Benefits

Open Access:

free for readers, with article processing charges (APC) paid by authors or their institutions.

High Visibility:

indexed within Scopus, SCIE (Web of Science), PubMed, PMC, MEDLINE, Embase, CAPlus / SciFinder, and other databases.

Journal Rank:

JCR - Q1 (Biochemistry and Molecular Biology) / CiteScore
- Q1 (Organic Chemistry)
