

# Joint Special Issue

## Extracellular Vesicles in Inflammation

### Message from the Guest Editors

Cells need to communicate with each other to exchange information and to fulfill their physiological roles. In addition to direct contact from cell to cell and exchange of soluble factors, there is a third method of information transfer that has received a lot of attention recently—extracellular vesicles (EVs). These vesicles in the nanometer range are responsible for the exchange of small and large molecules between cells and tissues and affect our bodies in a variety of ways. For the Special Issue “Extracellular Vesicles in Inflammation”, we accept both reviews and original articles. Reviews should provide a state-of-the-art overview of extracellular vesicles in the context of inflammation and may also highlight new approaches to enrich and characterize extracellular vesicles from biological fluids. Original Articles should address the pathophysiology of extracellular vesicles in experimental cell culture environments as well as in clinical practice, including new findings on the use of extracellular vesicles as biomarkers, and on new therapeutic strategies.
