Big Data Evaluation and Non-Relational Databases in eHealth

Message from the Guest Editor

The efficiency and effectiveness of applications that manage very large datasets have become critical in many domains. In the eHealth field, for example, there are many open medical datasets that can be deployed to design and implement systems that support the decisions of physicians in critical situations. Nowadays, there are Big Data available for medical electronic publications (such as PubMed), electronic health records (such as MIMIC), and tools to bring together multiple biomedical vocabularies to enable interoperability (such as the Unified Medical Language System). All these data need proper management as well as procedures for the reproducibility of the experiments that use these datasets. In this Special Issue, we want to evaluate non-relational approaches to these questions, and we propose the following topics of interests.

About the Journal

Message from the Editor-in-Chief

The concept of *Information* is to disseminate scientific results achieved via experiments and theoretical results in depth. It is very important to enable researchers and practitioners to learn new technology and findings that enable development in the applied field.

Information is an online open access journal of information science and technology, data, knowledge and communication. It publishes reviews, regular research papers and short communications. We invite high quality work, and our review and publication processing is very efficient.

Editor-in-Chief

Prof. Dr. Willy Susilo

School of Computer Science and Software Engineering, University of Wollongong, Northfields Avenue, Wollongong, NSW 2522, Australia

Author Benefits

Open Access:

free for readers, with article processing charges (APC) paid by authors or their institutions.

High Visibility:

indexed within Scopus, ESCI (Web of Science), Ei Compendex, dblp, and other databases.

Journal Rank:

CiteScore - Q2 (Information Systems)
