MRI Contrast Agents

Message from the Guest Editor

Magnetic Resonance Imaging (MRI) is one of the most powerful techniques used in clinical diagnostics and biomedical research. Due to the low sensitivity of MRI, the development of MRI contrast agents is a very active and wide field of research. There is a high diversity in the objects studied, ranging from small complexes to nanoparticles; the type of contrast agent, T1, T2 or Chemical Exchange Saturation Transfer (CEST); and their applications. The contrast agents in clinical use today are mainly non-specific. For better and early detection of diseases, targeted and responsive probes (which are selectively activated by a specific biomarker) are gaining increasing interest. Moreover, the combination of MRI and other imaging techniques enables to gain complementary information, and requires the development of multimodal probes. Finally, theranostic agents, that combine diagnostics and therapy in a single entity, represent a whole new area of development. This Special Issue aims to highlight the diversity of MRI contrast agents in terms of chemical structure and broad field of applications.

About the Journal

Message from the Editor-in-Chief

Inorganic chemistry remains a lynchpin of modern chemistry, not only embracing the function and reactivity of combinations of most elements of the periodic table, but also providing a footing for studies of materials, catalysts, drugs, fuels and industrial chemicals. Arguably, the role and reach of inorganics in society have never been as great as today. Adventurous research at the heart and at the extremes of inorganic chemistry is vital to further advances and Inorganics offers authors the opportunity to publish exciting new research in an open access format.

Editor-in-Chief

Prof. Dr. Duncan H. Gregory

School of Chemistry, University of Glasgow, University Avenue, Glasgow G12 8QQ, UK

Author Benefits

High Visibility:

indexed within Scopus, SCIE (Web of Science), CAPlus / SciFinder, and other databases.

Journal Rank:

JCR - Q2 (Chemistry, Inorganic and Nuclear) / CiteScore - Q2 (Inorganic Chemistry)

Rapid Publication:

manuscripts are peer-reviewed and a first decision is provided to authors approximately 14.9 days after submission; acceptance to publication is undertaken in 2.8 days (median values for papers published in this journal in the second half of 2025).
