Scorpionates: Recent Advances

Message from the Guest Editor

Since their discovery, poly(pyrazol-1-yl)borates have been considered as one of the most useful ligands in coordination and organometallic chemistry. Recent contributions in this area have not only led to a new understanding of their electronic and steric features, but also of the relevant applications of their metal complexes, such as enzyme models, biological properties, advanced materials, C–H activation, and polymerization. This Special Issue will summarize the evolution of scorpionates in the last ten years and will highlight the most important contributions to this mature class of chelating ligands.

About the Journal

Message from the Editor-in-Chief

Inorganic chemistry remains a lynchpin of modern chemistry, not only embracing the function and reactivity of combinations of most elements of the periodic table, but also providing a footing for studies of materials, catalysts, drugs, fuels and industrial chemicals. Arguably, the role and reach of inorganics in society have never been as great as today. Adventurous research at the heart and at the extremes of inorganic chemistry is vital to further advances and Inorganics offers authors the opportunity to publish exciting new research in an open access format.

Editor-in-Chief

Prof. Dr. Duncan H. Gregory

Author Benefits

High Visibility:

indexed within Scopus, SCIE (Web of Science), CAPlus / SciFinder, and other databases.

Journal Rank:

JCR - Q2 (Chemistry, Inorganic and Nuclear) / CiteScore - Q2 (Inorganic Chemistry)

Rapid Publication:

manuscripts are peer-reviewed and a first decision is provided to authors approximately 16.6 days after submission; acceptance to publication is undertaken in 2.5 days (median values for papers published in this journal in the first half of 2025).
