Message from the Guest Editor

Dear Colleagues,

Insects are ubiquitous. They live both on and in lands, waters, air and even other living beings—including other insects. They thus show a tremendous spectrum of adaptations to all possible habitats. Furthermore, some have to cope with significant and even extreme changes in living conditions (temperature, humidity, population size, etc.).

Behind such adaptations are DNA, gene expression, physiological, developmental, morphological and behavioural changes, which improve the insect's chances of survival and reproduction.

This Special Issue aims to gather original research articles as well as minireviews on molecular and non-molecular aspects relating to cases of insect adaptations to the environment.
