Message from the Collection Editors

Dear Colleagues,

Alongside their vital ecological roles, termites cause serious damage to wood and wood products worldwide. Termite management is one of the most important research topics in urban entomology. In this Special Issue, we would like to invite papers concerning different aspects of termite biology and management. Studies on termite behavior, ecology and physiology are welcomed, as well as new ideas and innovative technological trials from around the world focusing on future termite management. Contributions in the form of mini-reviews and short technical reports are also encouraged.
