Message from the Guest Editors

Dear Colleagues,

Insects have a major impact on all of our lives, from vectoring plant and animal diseases to eating or pollinating our crops. Good or bad, all insects are potentially at risk from parasites and diseases, be they parasitic wasps and flies, entomopathogenic worms, or microbial pathogens such as bacteria, viruses and fungi. This special issue will include original research articles and reviews by leading entomologists and associated experts. Articles will focus on the biology, ecology and evolution of the parasites and pathogens of beneficial and pest insects, and the molecular, physiological and genetic interactions between the two.

Prof. Kenneth Wilson
