Plant Manipulation by Insects: Galls, Green Islands, and More

Message from the Guest Editors

The induction of plant galls and green islands may be the most spectacular examples of how insects manipulate plants. Even processes as simple as insect feeding behaviors have also been shown to alter plants in ways that benefit insects. However, recent evidence suggests that broad-scale manipulation of plants by insects occurs in more subtle ways that can lead to modulation of plant defenses, manipulation of stomata leading to increased moisture content, higher leaf temperatures, and reduced emission of volatile organic compounds, and the alteration of nutrient partitioning within plants via the formation of mobilizing sinks. Research to understand more comprehensively how insects and their secretions impact the physiology, biochemistry, and gene expression of plants is in its infancy but will require an expanded toolbox of biochemical, immunohistochemical, and molecular approaches along with increased genetic resources for non-model organisms to expand our understanding.

Guest Editors

Prof. Dr. Edward F. Connor

Prof. Dr. Yoshihito Suzuki

Dr. David Giron

Deadline for manuscript submissions

closed (31 July 2024)

About the Journal

Message from the Editor-in-Chief

Editor-in-Chief

Prof. Dr. Brian T. Forschler
Department of Entomology, University of Georgia, 413 Biological
Sciences Building, Athens, GA 30602-2603, USA

Author Benefits

High Visibility:

indexed within Scopus, SCIE (Web of Science), PubMed,
PMC, PubAg, and other databases.

Journal Rank:

JCR - Q1 (Entomology) / CiteScore - Q1 (Insect Science)

Rapid Publication:

manuscripts are peer-reviewed and a first decision is
provided to authors approximately 18.1 days after
submission; acceptance to publication is undertaken in 2.9
days (median values for papers published in this journal in
the first half of 2025).
