

Special Issue

The Fossil Record of Immature Insects

Message from the Guest Editors

In modern ecosystems, insects play a crucial role, fulfilling various ecological functions. This is true for not only adults, but also for immature insects. The same was presumably the case in fossil ecosystems. Moreover, from the fossil record, a multitude of immature insects through all geological ages are known. Still, the fossil record of immature insects seems often underestimated. Research is mainly restricted to adult representatives, partly because immature insects can often not be determined to species level and hence are difficult to examine from a taxonomic point of view. However, different studies have demonstrated that fossils of immature insects can also provide important contributions to entomological research, for example, to developmental biology, ecology, biogeography, but also biodiversity. This Special Issue will address studies on immature insects in the fossil record, including contributions from all relevant areas of research. We welcome submissions in the form of original basic or applied research as well as reviews.

Author Benefits

High Visibility:

indexed within Scopus, SCIE (Web of Science), PubMed,
PMC, PubAg, and other databases.

Journal Rank:

JCR - Q1 (Entomology) / CiteScore - Q1 (Insect Science)

Rapid Publication:

manuscripts are peer-reviewed and a first decision is
provided to authors approximately 18.1 days after
submission; acceptance to publication is undertaken in 2.9
days (median values for papers published in this journal in
the first half of 2025).
