Insect Symbionts: Evolution and Application

Message from the Collection Editor

Microbes are ubiquitous in insects and have important consequences for their host's nutrition, behavior, and ecology. The consequences of the symbiont–host association encompass a continuum from beneficial effects, providing their hosts essential nutrients or protecting against pathogens and natural enemies to parasitism, influencing the reproduction of their host bacteria and, therefore, are an important factor influencing the ecology and evolution of their insect hosts. Consequently, they represent an important novel tool to control insect pests. This Special Issue will focus on the diversity and consequences of symbionts in various insect species including potential strategies involving their application to combat insect pests. We welcome submissions covering the whole spectrum of insect–symbiont interaction, such as occurrence and diversity of insect symbionts, symbiont-induced host evolution, symbiont evolution within insects, and the usage of symbionts to combat insect pests.

About the Journal

Message from the Editor-in-Chief

Editor-in-Chief

Prof. Dr. Brian T. Forschler
Department of Entomology, University of Georgia, 413 Biological
Sciences Building, Athens, GA 30602-2603, USA

Author Benefits

High Visibility:

indexed within Scopus, SCIE (Web of Science), PubMed,
PMC, PubAg, and other databases.

Journal Rank:

JCR - Q1 (Entomology) / CiteScore - Q1 (Insect Science)

Rapid Publication:

manuscripts are peer-reviewed and a first decision is
provided to authors approximately 18.1 days after
submission; acceptance to publication is undertaken in 2.9
days (median values for papers published in this journal in
the first half of 2025).
