Message from the Guest Editor

Sickle cell anemia (SCA) is a hereditary blood disorder characterized by the presence of abnormal hemoglobin, known as hemoglobin S (HbS), which causes red blood cells to become rigid and assume a sickle shape. This condition can lead to a range of complications, including chronic pain, organ damage, and increased susceptibility to infections. Over the years, there have been significant advancements in understanding the genetic epidemiology of sickle cell anemia and the development of new therapeutic strategies.
