Type 2 Diabetes: Update on Pathophysiology and Treatment

Message from the Guest Editor

Dear Colleagues,

Type 2 diabetes and its complications are among the most important health problems in the world. Nowadays, it is widely recognized that type 2 diabetes is associated not only with cardiovascular mortality, but also with poor quality of life due, for example, to chronic kidney disease, sarcopenia, cancer, and dementia. To overcome these problems, it is important to better understand the disease process of type 2 diabetes and its complications with the goal of developing new treatment strategies.

This Special Issue of the Journal of Clinical Medicine aims to invite authors to contribute original research articles as well as review articles related to the pathophysiology and treatment of type 2 diabetes and its vascular and non-vascular complications.
