Male Stress Urinary Incontinence: Clinical Treatment and Management

Message from the Guest Editors

Urinary incontinence has a considerable impact on the quality of life for men. It is estimated to affect 5% of males ages 19–44 and up to 30% of men over the age of 65. Of these patients, an average of 3% are impacted by stress urinary incontinence (SUI). SUI is a common health issue that has a considerable impact on patient quality of life for men. The etiology of SUI is typically is typically iatrogenic (prostatectomy and bladder outlet procedures). Because so many men are affected by SUI, there are many different treatment options available. Both therapies and workup have evolved over time. This Special Issue aims to collect high-quality contributions on the latest and most innovative advances in the diagnosis, evaluation, and management of male stress urinary incontinence. All researchers are invited to contribute original works and reviews.

About the Journal

Message from the Editorial Board

There has been an explosion of gene and target based research and therapeutics in the multitude of fields that compose clinical medicine. The *Journal of Clinical Medicine's* (JCM) staff and editorial board are dedicated to providing cutting edge, timely, and peer-reviewed articles covering the diverse subspecialties of clinical medicine. The journal publishes concise, innovative, and exciting research articles as well as clinically significant articles and reviews that are pertinent to the myriad of disciplines within medicine. The articles published are relevant to both primary care physicians and specialists. The journal's full-texts are archived in PubMed Central and indexed in PubMed. Please consider submitting your manuscripts for publication to our journal and check us out on-line!

Editors-in-Chief
