# New Clinical Advances in Psoriasis and Psoriatic Arthritis

### Message from the Guest Editors

Psoriasis is a common, chronic, inflammatory, immune-mediated skin disease with a high prevalence worldwide. It is a chronic, relapsing–remitting, inflammatory autoimmune disease involving several factors. The complexity of psoriasis is also reflected in the comorbidities that accompany psoriasis, mainly affecting the skin and joints. Recent therapeutic advances in psoriasis and psoriatic arthritis are compelling. We now have multiple options for treating the patient in front of us, but this also creates the dilemma of making the right treatment choice. This Special Issue aims to accumulate the latest reviews and original articles on psoriasis and psoriatic arthritis, with the aim of exploring the latest developments in all aspects of psoriasis and contributing to decision-making in our daily medical practice.
