Endocrine surgery has evolved rapidly in little more than three decades. The widespread interest in endocrine surgery is due to the complexity of the metabolic mechanisms, requiring discussion among surgeons, endocrinologists, oncologists, and nuclear physicians, and the level of precision and ability that the surgery requires. The aim of this Special Issue is to update our knowledge on the pathogenesis and clinical management of endocrine diseases. Particular emphasis will be placed on recent technological advances that have significantly improved outcomes. We invite scientists with expertise in this area to contribute relevant articles. We welcome clinical, experimental, and review articles offer new insights in the field of endocrine surgery and will provide our readers with an up-to-date overview of thyroid, parathyroid, and adrenal surgery.
