Clinical Management of Prosthetic Joint Infection (PJI)

Message from the Guest Editor

Prosthetic joint infection (PJI) is a serious complication that requires prompt and appropriate management to prevent further complications and improve patient outcomes. The clinical management of PJI typically involves a combination of surgical intervention and antimicrobial therapy. Surgical options may include DAIR or one- or two-stage revision arthroplasty, as well as some other proposed approaches. Moreover, plastic surgery is often required. Antimicrobial therapy is usually tailored based on the causative organism and may involve prolonged courses of intravenous or oral antibiotics. The close monitoring and management of the patients in a MDT approach is crucial, involving not only the aforementioned specialists but also microbiologists, pathologists, pharmacists, nurses and psychologists, among others. Therefore, we invite all of them to submit their work related to PJI management for inclusion in this Special Issue.

About the Journal

Message from the Editorial Board

There has been an explosion of gene and target based research and therapeutics in the multitude of fields that compose clinical medicine. The *Journal of Clinical Medicine's* (JCM) staff and editorial board are dedicated to providing cutting edge, timely, and peer-reviewed articles covering the diverse subspecialties of clinical medicine. The journal publishes concise, innovative, and exciting research articles as well as clinically significant articles and reviews that are pertinent to the myriad of disciplines within medicine. The articles published are relevant to both primary care physicians and specialists. The journal's full-texts are archived in PubMed Central and indexed in PubMed. Please consider submitting your manuscripts for publication to our journal and check us out on-line!

Editors-in-Chief

Prof. Dr. Emmanuel Andr s

Internal Medicine Department, University Hospital Strasbourg, 67000
